

to get access to the advanced management portal with APIs -----

---

I used "burp suite community" for this .

---

```
POST https://management.azure.com/subscriptions/{subscriptions-
id}/providers/Microsoft.DomainRegistration/generateSsoRequest?api-
version=2018-02-01
```

headers:-

```
1- Authorization: Bearer {long-authorization-token}"
```

---

the response will be something like this ---

---

HTTP/1.1 200 OK

Cache-Control: no-cache

Pragma: no-cache

Content-Type: application/json

Expires: -1

Vary: Accept-Encoding

Strict-Transport-Security: max-age=31536000; includeSubDomains

Connection: close

```
{"url":"https://sso.secureserver.net/v1/federation?xRequestId={Request-
Id}&app=dcc","postParameterKey":"saml","postParameterValue":"{very-long-
json-code}"}
```

----

copy the {Request-Id} and the {very-long-json-code}

----

now the Authorization request will be called by

----

```
POST https://sso.secureserver.net/v1/federation?xRequestId={request-
id}&app=dcc
```

headers:-

```
1- "Content-Type: application/json"
```

body:-

```
{"saml":"very-long-json-code}"}
```

-----

the above request will authenticate and redirect you to the "advanced management portal"

you can use any tool that can edit the HTTP requests to make your browser send it, i used "burp suite community" for this.
